History…

- In the prehistoric days, we used “inetd” to start net services
  - http://en.wikipedia.org/wiki/Inetd

HTTP/1.0 Keep-Alive

- In the very early days, web pages had few images, so 1 TCP connection per URL was not so bad
- HTTP/1.0
  - Keep-Alive extension added (but unevenly supported) to say “don’t hang up”
  - See Roy Fielding's early note:
    - http://ftp.ics.uci.edu/pub/ietf/http/hypermail/1995q4/0063.html
    - Now 404, see: http://web.archive.org/web/20081008002735/http://ftp.ics.uci.edu/pub/ietf/http/hypermail/1995q4/0063.html

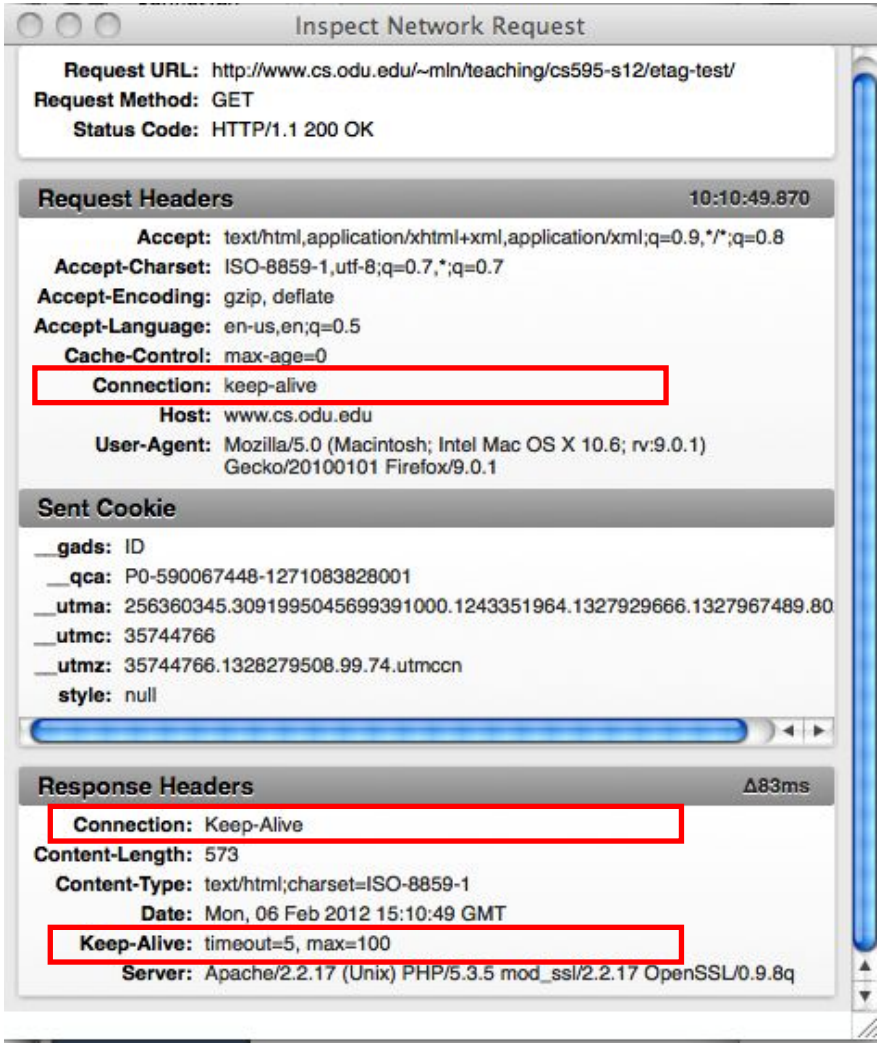
HTTP/1.1 Keep-Alive is Default

- HTTP/1.1
  - Persistent connections (as they are now called) are the norm
    - See section 19.7.1, RFC 2068; section 19.6.2, RFC 2616, sections 6.1 and A.1.2, RFC 7230
  - You now have to specify a non-persistent connection with `Connection: close`



Old Headers Die Hard…

(FF 9.0.1)

Common Method Properties

Safe	GET, HEAD, OPTIONS, and TRACE
Idempotent	Safe methods + PUT and DELETE
Cacheable	GET, HEAD, and POST

Long-lived Connections

- If the client does not send a "`Connection: close`" header, the server can assume the client wishes to maintain the TCP connection
- If the server sends a "`Connection: close`" header, the session is over

Pipelining Requests

6.3.2. Pipelining

A client that supports persistent connections MAY "pipeline" its requests (i.e., send multiple requests without waiting for each response). A server MAY process a sequence of pipelined requests in parallel if they all have safe methods (Section 4.2.1 of [RFC7231]), but it MUST send the corresponding responses in the same order that the requests were received.

(more retry/failure guidance in this section)

Timeout Not Specified in RFCs 2616 or 7230
(But see 6.5 of 7230)

KeepAliveTimeout Directive

Description: Amount of time the server will wait for subsequent requests on a persistent connection
Syntax: KeepAliveTimeout seconds
Default: KeepAliveTimeout 15
Context: server config, virtual host
Status: Core
Module: core

The number of seconds Apache will wait for a subsequent request before closing the connection. Once a request has been received, the timeout value specified by the Timeout directive applies.

Setting KeepAliveTimeout to a high value may cause performance problems in heavily loaded servers. The higher the timeout, the more server processes will be kept occupied waiting on connections with idle clients.

http://httpd.apache.org/docs/2.0/mod/core.html#keepalivetimeout

Apache Gives a 400 on Timeout

After waiting the timeout value, Apache just gives up and sends a 400

Now it seems to do nothing…

(in both examples below the magic blank line is not sent)

After waiting the timeout value, Apache now just gives up

Why Not a 408?

6.5.7. 408 Request Timeout

The 408 (Request Timeout) status code indicates that the server did not receive a complete request message within the time that it was prepared to wait. A server SHOULD send the "close" connection option (Section 6.1 of [RFC7230]) in the response, since 408 implies that the server has decided to close the connection rather than continue waiting. If the client has an outstanding request in transit, the client MAY repeat that request on a new connection.

I haven't seen a 408 in the wild, but we will implement it in A2
